Proposed Research work

8) i) Project Title: *Study of the Enhanced Magnetic Properties of nano Synthesized Mn Substituted Cobalt Ferrite as a Magnetostrictive Phase for ME composites.*

ii) Introduction

Magnetostrictive materials having industrially important material have aroused considerable interest during last decade. The basic properties of Magnetostrictive materials such as structural, electrical, and magnetic etc. have been the subject of tremendous interest to physicists, chemists and ceramists. The academic interest in the study of Magnetostrictive materials stems from the fact that they are the most important electronics and magnetic ceramics. The high potentials applications of Magnetostrictive materials in electronics microwave and computer technologist have focused the attention of many research workers on these materials. ferromagnetic have wide range of resistivity from semiconducting to insulating type. b) Grain size of individual crystallites, which influences the conduction path due to grain to grain contacts[1].

The present project proposal aims at a narrow section of this widely expanding area of research and development. Here the Magnetostrictive materials will be studied with the formation of Magnetostrictive materials to achieve higher values of quality factor (Q) and moderately lowered values of tunability.

• Origin of the Research Problem

The CoFe_2O_4 , Mn substituted CoFe_2O_4 (CMFO) and substituted LaSrMnO_3 (LSMO) has shown a very large Magnetostrictive strain [7,8]. The second subgroup consists of magnets that display a large degree of magnetostriction as a common property. The materials in this class exhibit dielectric anomalies at their magnetic ordering temperatures and/or significant magnetocapacitance. MnO , MnFe_2 , TmFeO_3 , $\text{Tb}_3\text{Fe}_3\text{O}_{12}$ can be listed in this category. The most prominent example of a magnetodielectric reported so far is EuTiO_3 . EuTiO_3 is an incipient ferroelectric (quantum ferroelectric). This means that there is a polar phonon mode associated with the dielectric constant, which tends to zero frequency as the temperature tends to zero.

• Interdisciplinary Relevance

In order to continue historic progress, innovative device structures and new materials have to be created in order to continue the historic progress in Magnetostrictive system devices. For over decades, there has been increasing demands of Ferro Magnetostrictive materials of electrical performance every 2 to 3 years[2]. However, it is also well accepted that this long-term range of the 65-nm to 35-nm nodes remains solidly in the "no-known solution" category. This will require new structural, material and fabrication technology solutions that are generally compatible with current and forecasted installed Magnetostrictive devices manufacturing[3]. So Magnetostrictive low loss magnetic materials makes the high frequency and low control voltage operation possible apart from the reduction in size. Such reduced size, power efficient spintronics device will be very attractive for space application[4, 5].

• Review of Research and Development in the Subject:

Recently it is also reported that in addition to frustrated magnets and Magnetostrictive magnets, the ceramic and thin film composites of ferroelectric and ferromagnetic also show promising magnetodielectric effect. The composites of Piezoelectric and Piezomagnetic compound sarrigated at nano-scale have also shown useful magnetoelectric and magnetodielectric coupling. Especially the composites of self-segregated clusters of magnetic CoFe_2O_4 and ferroelectric BaTiO_3 [9], BaTiO_3 - $\gamma\text{Fe}_2\text{O}_3$ nano particles [10] and super lattices combining ferromagnetic $(\text{La Ca})\text{MnO}_3$ with ferroelectric BaTiO_3 [5] are the few examples of MD systems.

• Significance of the study

The present project proposal aims at a narrow section of this widely expanding area of research and development. Here the Magnetostrictive materials will be studied with the

reduction of magnetostrictive materials to achieve higher values of quality factor (Q) and moderately lowered values of tunability.

III) Objective

As far as the measurement of λ is concerned, the literature shows that the tensometric techniques with the use of wire strain gauge is more commonly used as compared to interferometric arrangement to measure the change in length. Alternatively, the precision resistance meters or special purpose magnetostriction measurement units are costly and it would be interesting to design and develop a special purpose laboratory scale setup for the measurement of λ and standardize it by measuring λ on the materials like CoFe_2O_4 where earlier reports on λ are available [6].

iv) Methodology

For the present investigation following methodology will be adopted:

(i) Preparation of Materials:-

The materials will be prepared in the form of bulk via a chemical ceramic route or hydroxide co-precipitate technique will be used. This technique involves precipitation followed by condensation on some substrate. The materials will normally be taken oxides and nitrates or acetates. For precipitation acetates of Co will be mixed with ammonia in the presence of liquid ammonia as a complex. The required alkalinity of the medium will be acquired by adding NH_4OH . For reduction in size of particles, capping agents like thiophenol etc. will be used.

Different studies to characterize the prepared materials in bulk as well as nanoforms will be as follows:

(ii) Magnetic susceptibility / Magnetic permeability Studies:-

Such studies impart information's about the value and the nature of magnetism associated with the materials under study. The result of such studies will be compared from those of known magnetics studies. Normally susceptibility changes are expected under particle size reduction. Hence such studies will be useful in studying particle size effects.

(iii) Measurement of magnetostriction coefficient studies:-

Such studies are useful in understanding the effect of particle size on magnetostriction coefficient. Normally increases in magnetostriction coefficient are expected with reduction in particle size which may cause shift of ME or MD coefficient.

(iv) Scanning Electron Microscopic (SEM) studies:-

Such studies are useful regarding morphological features particle size etc. of the bulk. The nature of materials prepared and grain size etc. will be known from such studies. A correlation will be made between SEM and XRD studies.

(v) X-Ray Diffraction (XRD) Studies:-

For further characterization of these materials, X-ray diffraction (XRD) will be done. Parameters like crystal structure and the lattice constants etc. will be determined and correlated with nanoparticle studies.

(vi) The electrical conductivity studies: -

Proper electrodes will be formed on the pellet prepared by the silver paint technique and electrical conducting studies of the variety of bulk prepared will be undertaken under the excitations of temperature. Life time and mobility of the carries and the trap depth will be derived from such studies. Effect of particle size on electrical conductivity will also be investigated. Results obtained from the present studies will be interpreted in terms of either existing models or some new methods will be made, if required.

A. IDENTIFICATION

1. Project title

"Establishment of Shivaji University Scrap LEDs/ CFL Lamps Repairing Center Under E-waste Management"

Key Words: Shivaji University, LEDs / CFL, E-Waste.

2. Broad Area

(i) S&T Studies/Surveys. (St)

We have opted the use of Power Light Emitting Diodes(LEDs) Lamps and Compact Fluorescents Lamps (CFLs) to conserve electricity because the natural resources that provide the electricity are being exhausted. Conserving electricity saves money, since electricity prices are charged in accordance with the electricity consumed and also protects the environment because to generate electricity, most power plants burn coal, crude oil or other fossil fuels. In comparison with light intensity, the LEDs / CFL lamps found more efficient than the incandescent light bulbs.

(ii) Location Specific Research & Technology Development. (LSR)

There are also a large number of medical institutions, polytechnics, ITIs, management institutions, educational Institutes, Research Institutes, Universities, Hotels, Lodges, Malls, government offices etc. generally uses LEDs/ CFL lamps for lighting purpose. When the LEDs/ CFL are exhausted, these hundreds of LEDs/ CFL we thrown as a scrap material. So after thinking on this problem, I have found the solution to re-use the Scrap LEDs/ CFL.

(iii) S & T Demonstration Projects. (DP)

Already we have the E-Waste management Programme. From June 2014, Golden jubilee year of the Institute, Physics Department has successfully run the E-waste management programme for the faculty members. Under this, we repair the faulty electronics appliances free of charge (only charging the materials cost).

(iv) Replication of Successful Models. (RP)

As we are conducting the E-Waste management Programme, so we have the good confidence in repairing the electronics appliances. till today we have repaired more than 100 LEDs/ CFL.

(v) Joint S & T Programmes on specific theme. (please specify) (JP) Nil

(vi) Awareness & Training on specific topic. (Please specify) (TRG)

We have Conducted three days workshop with the title "Build your Own Stereo Amplifier", at school level for delivering the training to the students of class 9th and 10th. In this about 20 stereo amplifiers have assembled by the students. For this workshop funding was provided by the K.P.S.P.

School, Vishrambaug, Sangli. Besides demonstrated and write few innovative electronics articles and Published in reputed electronics magazine "Electronics For You" (Sheet attached separately)

4. Duration: (number of months): Nov 2022 to Oct, 2024. (24 months)

TECHNICAL DETAILS

1. Background

Description of problem

There are large number of medical institutions, polytechnics, ITIs, management institutions, educational Institutes, Research Institutes, Universities, Hotels, Lodges, Malls, government offices etc. generally today uses LEDs/ CFL lamps for saving electricity and lighting purpose. When the LEDs/ CFL lamps are exhausted, these hundreds of LEDs/ CFL we thrown as a scrap material. After thinking on this problem, we have found the solution to re-use the Scrap LEDs/ CFL lamps at the material cost (minimum charges) only.

Review of work already done

LEDs Lamps and Compact fluorescent lamps (CFLs) are available in different shapes and power ratings. These consist of an electronic Converter/ ballast circuit and a triple /twin type etc. fluorescent glass tube. Most LEDs Lamps and CFL manufacturers offer a guarantee of a year on their product. In an unserviceable LEDs Lamps only few Power LEDs are damaged due to ageing effect or high voltage. This particular damage in LEDs Lamp can be repaired simply by replacing single unit of power LED. In case of CFL, the filament has reached the end of its life. But there is every possibility that the electronic ballast circuit (PCB) inside the bottom of the CFL is in working condition. Many times there is always problem in filament of the glass tubes.

In repairing mode of LEDs Lamp, we remove the Cover. Investigate for number of faulty LEDs. After removing the faulty LEDs, the new LEDs are soldered in their place. In CFL Lamp, the used glass tubes replaced with new fluorescent glass tubes which are available in different sizes and wattages. We have carefully opened the base of LEDs/ CFL Lamp holder using an appropriate tool. The electronic Converter/ballast circuit on a circular PCB is observed inside the plastic case.

Rational for taking up the project

Actually the exhausted LEDs/ CFL lamp has little problem. Hence most of the electronics components are in working condition. In the fabrication of these devices like integrated circuits(ICs), transistors, FETs etc. many valuable metals like Gold, Silver, tungsten, Molybdenum etc. are used. By using these repaired LEDs/ CFL lamps it is equivalent to save thousands of rupees.

Technical support under the Scheme "E-Waste Management" is being provided for maintenance of Domestic home Appliances and sophisticated electronics instruments to the College employees by the Department of Physics.

Relevance to State priorities: Nil

2. Challenge

1. The students of B.Sc. electronics can be trained to do this work.
2. The required components can be made available from Kolhapur or Sangli.

Constraints

1. Difficult to collect the scrap LEDs/ CFL from lamp holders which are at height.
2. There is danger of getting hurt by glass while opening the lamp.

3. Description of Proposal

Objectives of the project. (Brief and to the point)

Most CFL manufacturers offer a guarantee of a year on their product. In an unserviceable CFL, the filament has reached the end of its life. But there is every possibility that the electronic ballast circuit inside the bottom of the CFL is in working condition. Many times there is always problem in filament of the glass tubes. In repairing, we remove the CFL glass tubes and replace them with new fluorescent glass tubes which are available in different sizes and wattages. The minimum charges of material cost under repairing the scrap CFL or scrap LEDs lamp will be borne by the institute who wants to repair the scrap CFL or scrap LEDs lamp.

Preliminary Investigations done by Organization. (if any): Nil

S&T component in the project.: Nil

Linkage with S&T Institutions / NGOs / resource persons / R&D organization /Industry for technical backup. Nil

Other organizations working in this area. Nil

Methodology detailing stepwise activities and sub-activities.

4. Work Plan

In first part of the project the scrap LEDs /CFLs lamps will be collected by sending email to different institute affiliated to the Shivaji University, Kolhapur.

After collection, in the middle part of the project, problems in each lamp are to be detected and reasonable repairing cost is communicated to their institute. The desired parts are then order from the vendors. After replacing the faulty part lamp are return to the institutes for their Re- use.

5. Output of the Project

It is estimated that the lamp having cost around Rs.400 - 500/- can be repaired only by removing an exhausted tube by new florescent glass tube. This offers the life to the lamp again for same period.

The amount collected against the repairing cost is further used for extension of the Project and development of the Institute.

6. Likely Impact (Please attempt to quantify): Nil

7. Parameters for monitoring effectiveness of project: Nil.

8. Suggested Post Project Activities: Nil.

Bhogawati sugar Factory:

Picture: Bhogawati Sugar Factory

'Shri Bhogawati Sahakari Sakhar karkhana Ltd., Shahunagar Parite' well-established co-operative sugar industry located at Parite near by Bhogawati river, so land is rich in water which is useful for sugar cane cultivation. The name of factory is derived from the name of river Bhogawati. The valley of this river is fertile due to the presence of water flowing through this river throughout the year. The factory is located some 22 km away to the south of Kolhapur, on the boundary of the village – Parite, on Kolhapur – Radhanagari state highway. Radhanagari dam filled with nature's beauty, surrounded by Karveer and Radhanagari taluka, which is best example of the consistent and coordinated efforts carried out by Hon. Late Shri Dadasaheb K. Patil-Kaulavkar (popularly known as Ababa **आबा**) and his colleagues.

Study Tour Report (2019-2020)

After independence like textile and sugar mills. In 1955 Dadasaheb K. Patil-Kaulavkar and his colleagues (promoters) proposed plan of sugar mill. They aimed at uplift the living standard of people in and around the functional areas of the factory. Today, when we turn back, we see the sweet fruits of the development and this certainly things which we can say proudly about miraculous changes in the social, political, economical, educational life style of people. The promoters convinced the importance of Sugar Industry the people and collected share capital. This shows their view to look the social and economical development. After consistent and perfect efforts of the promoters, the factory was registered on 18th Oct, 1955. Initial capacity of 1250 M.T. / day and 1958-59 was the first cursing season. The promoters motivated people to cultivate more sugarcane. This resulted in increased sugarcane production, and subsequently the licensing capacity was increased to 2000 M. T. / day. However tremended growth in sugarcane production compelled to increase the crush capacity to 4000 M. T. / day in 1993. Today we have same crush capacity, however with some updating and modification in exist machinery, we are able to crush at 4500 – 4800 M. T. / day.

Radhanagari Dam:

Tsunami Island:

Malvan is a small town located around 520 km from Mumbai in Sindhudurg District on the Konkan belt of Maharashtra. And the best aspect of this strip is that it boasts of some of the cleanest and quietest beaches in the state.

Tsunami Island at Devbaug is one of the major attractions to enjoy some watersports. Devbaug is about 4 km from Tarkarli, which is about 7 km from Malwan. Tsunami Island (near Devbaug beach) is a small island on the delta of Tarkarli River. Tsunami Island is in the back waters. It is a small little island with clear waters. 'Tsunami Island'- which gets submerged during high tides- and also old-fashioned boat rides to spot surfacing dolphins.

Sindhudurg Fort:

Picture: Sindhudurg Fort

Sindhudurg Fort (सिंधुदुर्ग किल्ला) is a historical fort that occupies an island in the Arabian Sea, just off the coast of Maharashtra in Western India. The fort was built by *Chhatrapati Shivaji Maharaj* (छत्रपती शिवाजी महाराज). The fortress lies on the shore of Malvan town of Sindhudurg District in the Konkan region of Maharashtra, 450 kilometres (280 mi) south of Mumbai. It is a protected monument.

This fort was constructed by *Chhatrapati Shivaji Maharaj*, the chhatrapati of the Maratha Empire. The main objective was to counter rising influence of foreign colonizers (English, Dutch, French and Portuguese merchants) and to curb the rise of Siddis of Janjira. Construction was supervised by Hirojee Indulkar, in 1664. The fort was built on a small island which was known as the Khurte bet.

The Great Shivaji Maharaj brought 200 Vaddera people for building this fort. Over 4,000 pounds of lead were used in the casting and foundation stones were firmly laid down. Construction started on 25 November 1664. Built over a period of three years (1664-1667), the sea fort is spread over 48 acres, with a two-mile (3 km) long rampart, and walls that are 30 feet (9.1 m) high and 12 feet (3.7 m) thick. The massive walls were designed to serve as a deterrent to approaching enemies and to the waves and tides of the Arabian Sea. The main entrance is concealed in such a way that no one can pinpoint it from outside. At a time when traveling by sea was banned by scriptures, this construction on an island

represents the revolutionary mindset of its engineer. A remain of an iron mound can be seen.
